**Quarterly Operation,
Maintenance, and
Monitoring Report
Groundwater Interim
Remedial Measure**

June 2013

1. Introduction

Pursuant to the Administrative Order on Consent (AOC) Index # W1-0018-04-01 (NYSDEC 2005), ARCADIS of New York, Inc. (ARCADIS), on behalf of Northrop Grumman Systems Corporation (Northrop Grumman), has prepared this Operable Unit 3 (OU3) Groundwater Interim Remedial Measure (Groundwater IRM) Quarterly Operation, Maintenance, and Monitoring (OM&M) Report for submittal to the New York State Department of Environmental Conservation (NYSDEC). The present day Bethpage Community Park property (Park) and the Former Grumman Plant 24 Access Road, which the NYSDEC has collectively termed the "Former Grumman Settling Ponds Area" and designated as OU3, are referred to herein as the Site Area. A Site Area Location map is provided on Figure 1.

The Groundwater IRM has been operational since July 21, 2009. This quarterly OM&M report summarizes the Groundwater IRM OM&M activities performed between April 1 and June 30, 2013 (hereinafter referred to as the reporting period). During this reporting period, the Remedial System and Environmental Effectiveness Monitoring Programs were conducted in accordance with the NYSDEC-approved OU3 Interim Groundwater IRM OM&M Manual (OM&M Manual) (ARCADIS 2009) and the remedial well maintenance program described in the 2011 Annual Report (ARCADIS 2012).

As discussed in the OU3 Site Area Remedial Investigation Report (Site Area RI) (ARCADIS 2011), Northrop Grumman does not take responsibility for certain compounds (e.g. Freon 12 and Freon 22), which are present in Site Area groundwater. Throughout this report, a distinction is made between the "Project" and "Non-project" Volatile Organic Compounds (VOCs), which are defined as follows:

- "Project VOCs:" are VOCs that may be related to former Grumman historical activities. For this report, Project VOCs are the VOCs listed in the Interim State Pollutant Elimination Discharge System (SPDES) permit equivalency (NYSDEC 2009), plus Toluene, Benzene, and Total Xylenes. A list of "Project VOCs" is provided in various tables throughout this report.
- "Non-project VOCs:" are VOCs, such as Freon 12 and Freon 22 that are unrelated to former Grumman activities but have been detected in the Site Area groundwater. As noted in the Site Area RI (ARCADIS 2011), a sub-plume of Freon 22 has been identified originating from the area of the Town of Oyster Bay's (Town's) former ice rink (shown on Figure 2). Based on Town information (Zervos, Theodore 2007), Freon 22 was used by the Town and released to the environment.

June 2013

2. Groundwater Interim Remedial Measure Objectives

The remedial action objectives (RAOs) for the Groundwater IRM are as follows:

- Mitigate the off-site migration of project-related, dissolved-phase VOCs. Specifically, the Groundwater IRM addresses:
 - Groundwater that has total volatile organic compound (TVOC) concentrations greater than 5 micrograms per liter ($\mu\text{g}/\text{L}$) in the upper 20 feet of the surficial aquifer across the 1,200-foot wide lateral extent of the southern Site Area boundary.
 - Groundwater below the upper 20 feet of the surficial aquifer that has TVOC concentrations greater than 50 $\mu\text{g}/\text{L}$ across the 1,200-foot wide lateral extent of the southern Site Area boundary.
- Comply with applicable NYSDEC standards, criteria and guidance values (SCGs) for treated water and air emissions.

3. Groundwater Interim Remedial Measure Description

The Groundwater IRM consists of:

- A “pump-and-treat system” where groundwater is:
 - Extracted along the southern portion of the Northrop Grumman Former Plant 24 Access Road via four remedial wells.
 - Conveyed to a treatment plant at McKay Field via four underground pipelines.
 - Treated via air stripping to reduce concentrations of Project and Non-Project VOCs.
 - Filtered to remove oxidized metals.
 - Returned to the aquifer, via a discharge pipeline routed to a recharge basin located on the adjacent former Bethpage Navy Weapons Industrial Reserve Plant (NWIRP) property.

June 2013

- A vapor phase treatment system that reduces concentrations of Project VOCs in the air stripper off-gas.
- A Groundwater Monitoring Network that is periodically monitored to assess the environmental effectiveness of the Groundwater IRM.

The major components of the Groundwater IRM are:

- Four Remedial Wells (RW-1, RW-2, RW-3, and RW-4) with design pumping rates of 30 gallons per minute (gpm), 75 gpm, 75 gpm, and 30 gpm, respectively, for a total design influent rate of 210 gpm.
- One low-profile air stripper to remove VOCs from the extracted groundwater prior to discharge to the recharge basins.
- Two bag filters configured so that one is “operational” and the other is in “stand by” mode. The system control logic automatically switches from the “operational” filter unit to the “stand by” filter unit when the bag filters are full to prevent a system shut down. The spent filters are then replaced and the unit is placed in “stand by” mode.
- Four emission control units (ECUs), two containing vapor phase granular activated carbon (VPGAC) and two containing potassium permanganate-impregnated zeolite (PPZ). The VPGAC ECUs treat the Project VOCs in the air stripper off gas, except for vinyl chloride, which is treated by the PPZ ECUs.
- The Groundwater Monitoring Network consists of 35 monitoring locations (i.e., 17 groundwater monitoring wells, 4 remedial wells, and 14 piezometers).

Additional information is provided in the OM&M Manual (ARCADIS 2009). The layout of the Groundwater IRM is shown on Figure 2 and a schematic drawing is provided on Figure 3. The groundwater sampling locations that form the Groundwater Monitoring Network are shown on Figure 4. Construction details for the monitoring wells and piezometers are provided in Appendix A.

4. Operation and Maintenance Activities

In general, the Groundwater IRM operated continuously during the reporting period with the exception of brief shutdown periods for routine maintenance and alarm conditions. Groundwater IRM operation and maintenance (O&M) activities

June 2013

conducted during the reporting period are described below and are summarized in Table 1:

- The system operated full-time, 89 out of 91 days (98 percent uptime).
- The system was monitored during the majority of business days via a site visit, a review of the daily reports, or remotely by wireless computer link-up.
- The Supervisory Control and Data Acquisition (SCADA) system operated as designed, and when conditions warranted (see below), shut the system down automatically and instantaneously, and provided notification of system advisories and alarms to plant operators.
- Intentional system shutdowns included (see Table 1 for more information):
 - Valve cleaning at RW-2 and RW-3 (May 10, 2013).
 - Replacement of two problematic Secondary Fail-Safe (SFSI) pressure switches (May 13, 2013).
 - System operation was temporarily modified (i.e. turning wells on and off and reducing pumping rates) to allow the RW-2 and RW-3 pipelines to be inspected and assessed for potential cleaning (May 20, 2013).
 - Preventative quarterly maintenance on Remedial Wells RW-2 and RW-3, which consisted of injecting carbon dioxide into the remedial wells to rehabilitate the wells and to help address iron fouling issues (May 22, 2013).
 - Vapor phase granular activated carbon and potassium permanganate media change-outs (May 30, 2013).
 - Air stripper maintenance (June 3 and 10, 2013).
- Unintentional system shutdowns included (see Table 1 for more information):
 - Air stripper high-pressure condition (April 9, 2013): Problem: air stripper fouling caused by build-up of iron particulate. Solution: temporary reduced air flow rate until air stripper internals were powerwashed.

June 2013

- Temporary power supply interruptions (April 25, May 17, and June 16, 2013). The system was restarted without incident the same day or the following morning without incident, after the system was checked for problems.
- Bag Filter Fault (May 24, 2013): Problem: Both bag filters clogged up overnight.

5. Treatment System Compliance and Performance Monitoring

5.1 System Monitoring Activities

The following compliance and performance monitoring activities were performed during this reporting period (see Appendix B, Table B-1 for a summary of the compliance and performance monitoring program requirements):

- Three (3) sampling events to collect required monthly water samples and quarterly air samples.
- Thirteen (13) weekly site visits to monitor and record key system operational parameters.
- The following additional, non-routine monitoring activities were performed during this reporting period to assess system performance:
 - RW-2 and RW-3 water samples were analyzed for total and dissolved iron during each of the three monthly sampling events to help assess iron fouling impacts. Results are provided in Appendix B.

The system operation and monitoring results are summarized in the following tables, graphs, and appendices:

- An Operational Summary, including monitoring events, system operational days, and noteworthy site activities (Table 1).
- Summary of Influent and Effluent Water Sample Analytical Results (Tables 2 and 3, respectively). Table 3 also provides the Groundwater IRM treatment system removal efficiency. Complete validated Water Sample Analytical Result Summaries for each sampling event are included in Appendix B.

June 2013

- Summary of Influent and Effluent Vapor Sample Analytical Results (Tables 4 and 5, respectively). Table 5 also provides the Groundwater IRM treatment system removal efficiency. Complete, validated Vapor Sample Analytical Results, for each sample event, are included in Appendix C.
- System Parameters including flow rates, line pressures, and temperatures (Table 6).
- Summaries of Groundwater Recovered, VOC Mass Recovered, and VOC Recovery Rates (Table 7). Table 7 provides a breakdown of these parameters by Remedial Well and System and also breaks down the VOC Mass Recovered and VOC Recovery Rates into Project, Non-Project, and Total VOCs.
- Air Discharge Quality Evaluation and Compliance Table (Appendix D and Table 8, respectively).
- Concentrations of VOCs and Metals in Remedial Well Groundwater Samples (Tables 9 and 10, respectively).
- Cumulative Total, Project, and Non-Project VOC Mass Removed (Figure 5).
- Remedial Well Total, Project, and Non-Project VOC Concentrations (Figures 6A, 6B, and 6C, respectively).
- Influent Total, Project, and Non-Project VOC Concentrations (Figure 7).
- Total, Project, and Non-Project VOC Mass Recovery Rates (Figures 8A, 8B, and 8C, respectively).

5.2 Summary of OM&M Results and Conclusions

5.2.1 System Operation and Effectiveness

Groundwater IRM OM&M results and conclusions for the reporting period are summarized below:

- Total volume of groundwater recovered and treated (Table 7):
 - 2nd Quarter 2013: 26 million gallons.

June 2013

- Cumulative Total: 404 million gallons.
- Total VOC mass recovered (Table 7 and Figures 5, 8A, 8B, and 8C):
 - 2nd Quarter 2013: 48 pounds (lbs) of VOCs.
 - Cumulative Total: 1,887 lbs of VOCs.
 - The majority of VOCs recovered during this quarterly reporting period were Project VOCs (69% or 33 lbs), which continues the trend that started in the fourth quarter of 2012.
- Well-specific VOC mass recovered and mass removal rates (Table 7 and Figures 8A, 8B, and 8C):
 - The majority of Project VOCs were recovered by RW-2 (97%) and RW-3 (3%).
 - The majority of the Non-Project VOCs were recovered by RW-3 (66%) and RW-4 (31%).
- Treatment system influent concentrations (Table 2 and Figure 7):
 - Project VOC influent concentrations (104 µg/L to 121 µg/L) are generally consistent with concentrations since the middle of 2010, and are significantly below the peak concentration of ~1,000 µg/L (in July, 2009).
 - Non-Project influent concentrations (40 to 55 µg/L) are continuing the decreasing trend that started in 2010, and are well below the peak concentration of 650 µg/L (in May 2010).
 - Mercury has not been detected in an influent sample since system start-up.
- Total Project VOC concentrations in Remedial Wells RW-1 and RW-4 are below 5 µg/L, which is the most stringent RAO (Table 9).
- Metals concentrations in the remedial wells during this reporting period (Table 10) are consistent with historical metals concentrations with the exception of the elevated iron concentrations (1,070 and 990 µg/L total iron) in the April and July 2013 RW-2 samples, respectively. The elevated RW-2 total iron concentrations are believed to be attributed to the iron precipitate that coats the well and pipeline,

June 2013

specifically, small pieces of the iron precipitate can break off and become entrained in the influent groundwater.

- The air stripper, air stripper off-gas treatment system, and bag filter system performed within acceptable parameters for this reporting period, as indicated by:
 - The air stripper VOC removal efficiency was greater than 99.9 percent for Project and Non-Project VOCs (Table 3).
 - Both the water and air discharges complied with their applicable standards, criteria, guidance values (SGCs) and discharge limits (Tables 3, 5, and 8).

5.2.2 Regulatory Status of Discharges

5.2.2.1 Air Discharge

To determine the compliance status of air discharge from the Groundwater IRM treatment system, the system's effluent vapor concentrations were compared to NYSDEC Division of Air Resources Air Guide-1 (DAR-1) Model Short-term Guideline Concentrations (SGCs [NYSDEC 2010]) (Table 5) and the effluent vapor laboratory results were compared to a site-specific modeled annual maximum allowable stack concentration (MASC). The annual MASC was calculated during each monitoring event for individual compounds using the output from the USEPA SCREEN3 Model in conjunction with the NYSDEC DAR-1 AGCs. A scaling factor was calculated using the SCREEN3 model with site-specific physical layout information (e.g. building dimensions, stack height, terrain, etc.) and operating data (e.g. air flow rate, temperature, etc.) inputs for each monitoring event. The scaling factor was then used to adjust (scale) the NYSDEC DAR-1 AGC to a site-specific MASC. A summary of the instantaneous percent (i.e., not time- weighted) of the site-specific annual MASC for Project VOCs, Freon 12, and Freon 22 is provided in Table 8. A summary of the cumulative annual percent (i.e. time-weighted) of the site-specific MASC for detected compounds is also provided in Table 8. A summary of the model inputs, outputs, and backup calculations is provided in Appendix D.

The Groundwater IRM air effluent met NYSDEC requirements throughout the reporting period as indicated by the following:

- The measured concentrations of individual VOCs in the vapor effluent did not exceed applicable SGCs (Table 5).

June 2013

- The measured concentration of individual VOCs in the vapor effluent did not exceed their applicable, instantaneous MASCs, as calculated using the USEPA SCREEN 3 Model (Table 8). Similarly, the time-weighted rolling averages for the individual Project VOCS, Freon 12, and Freon 22 are below their respective MASCs.

5.2.2.2 Water Discharge

The Groundwater IRM treated water effluent met NYSDEC regulatory requirements during the reporting period (Table 3).

6. Environmental Effectiveness Monitoring

Groundwater IRM treatment system environmental effectiveness (i.e., hydraulic monitoring and groundwater quality monitoring) activities and results for this reporting period are discussed below.

6.1 Hydraulic Monitoring

6.1.1 Activities

In accordance with OM&M Manual requirements and methodologies (ARCADIS 2009), a quarterly round of groundwater hydraulic monitoring was performed during this reporting period. Specifically, depth-to-water measurements were collected on May 13, 2013 from 35 locations forming the approved monitoring well network (Table 11 and Figure 4).

6.1.2 Results

Figure 4 shows the configuration of the shallow potentiometric surface and the inferred horizontal groundwater flow directions on May 13, 2013 at the Site Area.

An evaluation of vertical hydraulic gradients was also conducted. The vertical hydraulic gradient is a measure of the potential for vertical groundwater flow between two vertically separated, closely spaced observation points (i.e., clustered or nested observation wells). The magnitude of the gradient indicates the steepness of the gradient, and the sign of the gradient indicates the direction of vertical flow (i.e., a positive vertical gradient indicates upward flow, while a negative vertical gradient indicates downward groundwater flow). The gradient does not provide information with

June 2013

respect to the rate of groundwater movement, which is affected by the hydraulic conductivity of the aquifer material through which the water is moving.

Table 12 provides a summary of calculated vertical groundwater hydraulic gradients at key well pairs located along the Site Area southern boundary during the May 13, 2013 hydraulic groundwater monitoring event. The vertical hydraulic gradients generally indicate that shallow groundwater is moving downward and deeper groundwater is being drawn upward towards the recovery well screened intervals.

Figure 9 provides a cross-sectional view of vertical groundwater flow (based on groundwater levels measured on May 13, 2013), combined with a cross section of Project VOC concentrations in groundwater above 5 µg /L (based on results from October 2012 groundwater sampling round). Figure 9 indicates groundwater containing Project VOCs above 5 µg/L is being drawn toward the well screens of remedial wells (i.e., RW-1 through RW-4) within the area, which is consistent with the evaluation of vertical groundwater hydraulic gradient.

Figure 9 in combination with Figure 4 indicate that Groundwater IRM provides effective vertical and horizontal hydraulic control of groundwater containing Project VOC concentrations above 5 µg /L; therefore, the Groundwater IRM satisfies its remedial action objective.

6.2 Groundwater Quality Monitoring

6.2.1 Activities

Consistent with the OM&M Manual (ARCADIS 2009), groundwater quality monitoring was not required during the Second Quarter of 2013.

6.2.2 Results

Historical groundwater quality data are summarized on the following tables:

- Table 13 summarizes the results of laboratory analysis of VOCs in groundwater samples collected from the groundwater network wells to date.
- Table 14 summarizes the results of laboratory analysis of metals in groundwater samples collected from the groundwater network wells to date.

June 2013

When an appropriate amount of data has been collected, trend graphs will be developed for selected wells.

6.3 Environmental Effectiveness Monitoring Conclusions

Evaluation of the operational hydraulic groundwater monitoring data, as shown on Figure 4, indicates that the Groundwater IRM is operating as designed and the associated capture zone has developed.

Figure 9 indicates that the Groundwater IRM is preventing the off-site migration of groundwater with Project VOC concentrations greater than 5 µg/L.

7. Groundwater IRM Recommendations

- Remove mercury from the SPDES equivalency monitoring program because mercury has never been detected in any system water sample.
- Based on the results of the pipeline assessment performed on May 20th, the RW-2 pipeline should be cleaned to remove the iron build-up inside the pipeline. This maintenance work is scheduled to be performed during the next reporting period.
- Continue operating, maintaining, and monitoring the system in accordance with the Groundwater OM&M Manual (ARCADIS 2009) including the current quarterly preventive maintenance program performed at Remedial Wells RW-2 and RW-3 to remove iron build-up in the wells and pipelines.
- Based on the consistent operation of the Groundwater IRM since July 2009, we recommend that the current, quarterly reporting frequency be reduced to annual. Consistent with the NYSDEC-approved OU3 Groundwater IRM OM&M Manual (ARCADIS 2009), an annual report will be prepared to summarize system operation, performance, and monitoring data; this annual report will be prepared and submitted under the supervision of a licensed, professional engineer. Additionally, pertinent data collected for the Groundwater IRM will be submitted to the NYSDEC as part of the semi-annual progress reports currently completed in accordance with Section III of AOC Index #W1-0018-04-01. Upon receipt of NYSDEC approval of this recommendation, the OU3 Groundwater IRM OM&M Manual (ARCADIS 2009) will be updated to reflect this change.

(Former Grumman Settling Ponds), Bethpage, New York.

Notes:

- (1) Days in which the system was operational for the majority of the day are counted as one day.

1st Quarter 2013

- (2) The system was intentionally shut down at ~4:15 PM on February 8, 2013 in anticipation of Winter Storm Nemo. The system was restarted at ~ 11AM on February 10, 2013 after the storm had passed and the system had been inspected for potential damage.
- (3) The system shut down at 2:36 AM on February 14, 2013 due to both 401 BF & 402 BF fouling over a shorter than expected time frame, resulting in high-high pressure alarm and system shutdown. The system was restarted later that morning and was off-line for approximately 9.5 hours.
- (4) The system was shut down at 9:05 AM on February 27, 2013 for preventative maintenance activities at Remedial Wells RW-2 and RW-3. In addition to the rehabilitation program, the RW-2 pump was pulled, replaced with a spare pump, and subsequently cleaned for future use. Upon initial restart, the system shut down due a low pressure alarm caused by a plugged secondary, fail-safe (SFSI) pressure switch. The switch was cleaned and system was restarted at ~ 3PM on March 1, 2013. The system was down for approximately 77 hours. Over the next two days (March 2 & 3, 2013) multiple bag filter switchovers occurred and at one point the system was off-line for approximately 5.5 hours because two switchovers occurred in rapid succession.
- (5) Between March 5 and March 28, the system shut down five (5) times due to problems associated with the RW-2 and RW-3 SFSI pressure switches, specifically:
- a) The system shut down at 10:34 AM on March 5, 2013 due to a low-pressure alarm. System was checked and restarted that afternoon, and was off-line for approximately 2.5 hours.
 - b) The system shut down at 1:43 PM on March 9, 2013 due to a low-pressure alarm. The RW-2 and RW-3 switches were manually cleaned, and system was restarted the next morning, with RW-3 running at a reduced flow rate of 65 gpm. The system was off-line for approximately 21 hours.
 - c) The system could not be restarted after the air stripper cleaning on March 14, 2013 (see Note 6) due to pressure switch issues. The problematic RW-3 pressure switch was switched with the RW-4 pressure switch, and the system was restarted.
 - d) The system shut down at 11:54 AM on March 15, 2013 due to a low-pressure alarm from the failing RW-4 SFSI pressure switch. The primary RW-4 pressure switch was tested was working correctly. The problematic, secondary/redundant switch (the SFSI switch) was taken off-line. The system was restarted that afternoon and was off-line for approximately 3.25 hours. [Problematic SFSI switches were replaced on May 13, 2013, See Note 10]
 - e) The system shut down at 12:26 PM March 28, 2013 due to a problematic SFSI switch. The system was restarted later that afternoon and was off-line for approximately 2 hours.
- (6) The system was shutdown at 10:32 AM on March 14, 2013 for a periodic air stripper cleaning using a pressure washer. After the air stripper cleaning, there was a problem restarting the system (see Note 5c). The system was restarted that afternoon and was off-line for approximately 6 hours.

2nd Quarter 2013

- (7) The system shut down at 3:36 PM on April 9, 2013 due to blower discharge high-pressure alarm. The air flow rate was temporarily reduced and the system was restarted later that afternoon and was off-line for approximately 0.8 hours.
- (8) The system shut down twice on April 25, 2013, at 11:38 AM and 1:55 pm, due to temporary power supply interruptions. The system was restarted at 12:08 PM and 2:11 PM, respectively, after the system was inspected for any problems. The system was off-line for a total of approximately 1 hour.
- (9) The system was shut down at 9:25 AM on May 10, 2013 to remove iron precipitate build-up in the RW-2 and RW-3 valves located in the treatment building. The system was restarted that afternoon and was off-line for approximately 7 hours.
- (10) The problematic SFSI pressure switches (see Note 5 above) were replaced on May 13, 2013.
- (11) The system shut down at 7:43 PM on May 17, 2013 due to a temporary power supply interruption. The system was restarted the next morning after the system was inspected for any problems. The system was off-line for approximately 12 hours.
- (12) The system was run with Remedial Well RW-2 off-line from 8:21 AM to 1:30 PM and from 3:11 PM to 5:32 PM on May 20, 2013 for a pipeline inspection. The system was operated at a reduced flow rate for approximately 6.5 hours.
- (13) The system was shut down at 08:11 AM on May 22, 2013 for preventative maintenance activities at Remedial Wells RW-2 and RW-3. In addition to the normal rehabilitation work, the RW-2 and RW-3 pumps were pulled and replaced with spare pumps and motors. The system was restarted the next day and was off-line for approximately 29 hours. Multiple bag filter switches occurred during the start up of the system.

Table 1. Operational Summary, Groundwater Interim Remedial Measure, Operable Unit 3
(Former Grumman Settling Ponds), Bethpage, New York.

Notes continued:

- (14) The system shutdown at 2:21 AM on May 24, 2013 as a result of rapid succession of bag filter changes overnight. The system was restarted the next morning and was off-line for approximately 8 hours.
- (15) The system was shutdown at 7:40 AM on May 30, 2013 for vapor phase granular activated carbon and potassium permanganate change-outs. The system was initially restarted at 4:46 PM that afternoon but the system shutdown at 6:01 PM due to blower high discharge pressure. The blower's VFD settings were changed and the system was restarted at 7:13 PM. The system was off-line for a total of ~10 hours.
- (16) The system was shutdown at 1:07 PM on June 3, 2013 for a periodic air stripper cleaning using a pressure washer. The system was restarted at 6:46 PM and was off-line for approximately 5.8 hours.
- (17) The system was shutdown at 2:30 PM on June 10, 2013 for a periodic air stripper cleaning using a pressure washer. The system was restarted at 6:53 PM and was off-line for approximately 4.5 hours.
- (18) The system shut down at 3:21 AM on June 16, 2013 due to a temporary power supply interruption. The system was restarted at 10:06 AM on May 18, 2013 after the system was inspected for any problems. The system was off-line for approximately 5.6 hours.

Table 2. Summary of Influent Water Sample Analytical Results, Groundwater Interim Remedial Measure, Operable Unit 3
 (Former Grumman Settling Ponds), Bethpage, New York.⁽¹⁾

Notes:

- (1) Water samples collected by ARCADIS on the dates shown and submitted to Columbia Analytical Services, Inc. for VOC analyses per NYSDEC ASP 2000, Method OLM 4.3, for iron analyses per USEPA Method 6010 and for mercury analyses per USEPA Method 7470. The VOC analyte list is provided in the DRAFT Groundwater IRM OM&M Manual (ARCADIS 2009). Influent water samples were collected from Water Sampling Port-5 (WSP-5); refer to Figure 3 of this OM&M Report for the schematic location of WSP-5. Data in this table corresponds to approximately the past year of system operation.
- (2) Only VOCs associated with the interim SPDES equivalency program, plus Toluene, Benzene, Xylenes, non-project related Freon 12 and Freon 22, Mercury and Iron are included in this table. Complete VOC and inorganic data summary tables, including VOC TICs, are provided in Appendix B. Laboratory data qualifiers are included in the Appendix B tables.
- (3) "Total VOCs" represents the sum of individual concentrations of the compounds detected. The values used in calculations referenced in this report have been rounded to the nearest whole number.
- (4) pH samples collected and measured in the field by ARCADIS personnel on the dates listed using an Oakton Model 300 pH/conductivity meter. pH units are standard units.
- (5) The March 2013 pH influent data was compromised, so an estimated value based on the average of available pH values (from Remedial Wells RW-2 and RW-3) is provided.

Acronyms\Key:

700	Bold data indicates that the analyte was detected at or above its reporting limit.
16	Data that is not bold indicates analyte detected but below its reporting limit; the value is estimated.
IRM	Interim remedial measure.
NA	Not analyzed.
ND	Analyte not detected at, or above its laboratory quantification limit.
NYSDEC	New York State Department of Environmental Conservation.
OM&M	Operation, maintenance and monitoring.
SPDES	State Pollutant Discharge Elimination System
TICs	Tentatively identified compounds.
USEPA	United States Environmental Protection Agency.
VOC	Volatile organic compound.
µg/L	Micrograms per liter.

Table 5. Summary of Effluent Vapor Sample Analytical Results, Groundwater Interim Remedial Measure, Operable Unit 3
 (Former Grumman Settling Ponds), Bethpage, New York.⁽¹⁾

Notes:

- (1) Vapor samples collected by ARCADIS on the dates shown and submitted to Columbia Analytical Services, Inc. for VOC analyses per Modified USEPA Method T0-15. A VOC analyte list is provided in the DRAFT Groundwater IRM OM&M Manual (ARCADIS 2009). Effluent samples were collected at Vapor Sampling Port-5 (VSP-5); refer to Figure 3 of this OM&M Report for the location of VSP-5. Data in this tables corresponds to approximately the past year of system operation.
- (2) Only VOCs that are associated with the interim SPDES equivalency program, Toluene, Benzene, Xylenes, and non-project related Freon 12 and Freon 22 are included in this table. Complete VOC summary tables, including VOC TICs, are provided in Appendix C. Laboratory data qualifiers are included in the Appendix C tables.
- (3) Discharge limit is compound specific short-term guidance concentration (SGC) per the NYSDEC DAR-1 AGC/SGC tables revised October 18, 2010.
- (4) An SGC was not provided in the DAR-1 AGC/SGC Tables, dated October 18, 2010. An interim SGC was developed based on guidance of the New York State DAR-1 Guidelines for the Control of Toxic Ambient Air Contaminants, 1991 edition. Specifically for 1,1-dichloroethene, which is not defined as provided in Section IV.A.2.b.1 a high-toxicity compound, the Interim SGC = (smaller of Time Weighted Average [TWA] - Threshold Limit Value or TWA - Recommended Exposure Limit)/4.2. or 1,600 µg/m³ / 4.2 = approximately 380 µg/m³. An interim SGC was developed for this compound because it has a moderate toxicity rating, as specified in the DAR-1 AGC/SGC Tables, dated October 18, 2010.
- (5) An SGC was not provided in the DAR-1 AGC/SGC Tables, dated October 18, 2010. An interim SGC was developed based on guidance provided in Section IV.A.2.b.1 of the New York State DAR-1 Guidelines for the Control of Toxic Ambient Air Contaminants, 1991 edition. Specifically for cis-1,2 dichloroethene, which is not defined as a high-toxicity compound, the interim SGC = (smaller of Time Weighted Average [TWA] - Threshold Limit Value or TWA - Recommended Exposure Limit)/4.2 or 790,000 µg/m³ / 4.2 = approximately 190,000 µg/m³. An interim SGC was developed for this compound because it has a moderate toxicity rating, as specified in the DAR-1 AGC/SGC Tables, dated October 18, 2010.
- (6) "Total VOCs" represents the sum of individual concentrations of all compounds detected. The values used in calculations referenced in this report have been rounded to the nearest whole number.
- (7) Treatment efficiency was calculated by dividing the difference between the influent and effluent Total VOC concentrations by the influent Total VOC concentration. Treatment efficiency is only calculated when there is a corresponding influent sample.
- (8) Treatment efficiency was calculated by dividing the difference between the influent and effluent total Project VOC concentrations by the influent total Project VOC concentration. Treatment efficiency is only calculated when there is a corresponding influent sample.

Acronyms\Key:

700	Bold data indicates that the analyte was detected at or above its reporting limit.
16	Data that is not bold indicates analyte detected but below its reporting limit; the value is estimated.
AGC	Annual guideline concentration.
IRM	Interim remedial measure.
NA	Not applicable.
ND	Analyte not detected at or above its laboratory reporting limit.
NS	Guideline concentrations not specified in the NYSDEC DAR-1 AGC/SGC tables revised September 10, 2007. An interim SGC was not developed for these compounds because they have low toxicity ratings in the NYSDEC DAR-1 AGC/SGC tables revised October 18, 2010.
NYSDEC	New York State Department of Environmental Conservation.
OM&M	Operation, maintenance, and monitoring.
SPDES	State Pollutant Discharge Elimination System
TICs	Tentatively identified compounds.
USEPA	United States Environmental Protection Agency.
VOC	Volatile organic compound.
µg/m ³	Micrograms per cubic meter.

Table 6. Summary of System Parameters, Groundwater Interim Remedial Measure, Operable Unit 3
(Former Grumman Settling Ponds), Bethpage, New York.

Notes:

- (1) Operational data collected by ARCADIS on days noted. Parameters listed were typically recorded during compliance monitoring events. Data in this table corresponds to approximately the past year of system operation.
- (2) Instantaneous values from field-mounted instruments, except for the combined influent water-flow rate, which is the sum of individual well flow rates via the Supervisory Control and Data Acquisition (SCADA) System.
- (3) Remedial Well effluent pressure readings measured at the influent manifold within the treatment system building.
- (4) Stack temperature measured using infrared temperature gun.
- (5) ECU Mid-train temperature used because stack effluent gauge could not be read.
- (6) Water samples taken on October 1, 2012, air samples taken on October 3, 2012. Air parameters shown reflect conditions on the air sampling date.
- (7) Influent pressures to ECUs not recorded on day of sampling, the average of the next two site visits in December were used.
- (8) Starting with January's 2013 site visit the following instantaneous parameters are obtained from the SCADA HMI: Water Flow Rate, Water Pressure, Air Flow Rate.
- (9) System effluent pressure not recorded on day of sampling, the average of the next two site visits in May were used.

Acronyms\Key:

ECU	Emission control unit.
gpm	Gallons per minute.
inH ₂ O	Inches of water column.
psi	Pounds per square inch.
°R	Degrees Rankine.
scfm	Standard cubic feet per minute.
Temp.	Temperature.

Table 7. Summary of Groundwater Recovered, VOC Mass Recovered, and VOC Mass Recovery Rates, Groundwater Interim Remedial Measure, Operable Unit 3
 (Former Grumman Settling Ponds), Bethpage, New York.

Notes:

- (1) Represents operating period between consecutive monitoring events.
- (2) Volume of groundwater recovered is based on individual local well totalized flow readings. Listed value is the difference between totalized flow values recorded between consecutive monitoring events. The total groundwater recovered during a given operating period is the sum of the individual well flow totals. Values shown are rounded to the nearest gallon, but should only be considered accurate to two significant figures to account for error associated with field measurements.
- (3) Mass recovered per well was calculated by multiplying the TVOC concentration from the most recent sampling event by the number of gallons extracted during the reporting period. The total amount recovered during a given operating period is the sum of masses recovered from each of the individual wells. Values less than ten pounds are presented using two significant figures and values greater than ten pounds have been rounded to the nearest whole number; however, these values should only be considered accurate to two significant figures to account for error associated with field measurements and analytical data.
- (4) Mass recovery rates were calculated by dividing the total mass recovered for each well and for the system by the number of days in the respective operating period. Values are presented using two significant figures.
- (5) "Total VOCs" represents the sum of individual concentrations of the VOCs detected.
- (6) "Project VOCs" represents the sum of individual compound concentrations of 1,1,1-Trichloroethane; 1,1-Dichloroethane; 1,2-Dichloroethane; 1,1-Dichloroethene; Tetrachloroethene; Trichloroethelyene, Vinyl Chloride; cis-1,2-Dichloroethene; trans-1,2-Dichloroethene; Benzene; Toluene; and Xylenes-o,m, and p.
- (7) "Non-Project VOCs" represents the difference between Total VOCs and Project VOCs.
- (8) Values based on operational data recorded prior to system startup on July 21, 2009.
- (9) The volume of groundwater recovered and mass recovered calculations represent the operational period between system start-up on July 21, 2009 and December 30, 2009.
- (10) The volume of groundwater recovered and mass recovered calculations represent the operational period between December 30, 2009 and January 5, 2011.
- (11) The volume of groundwater recovered and mass recovered calculations represent the operational period between January 5, 2011 and January 9, 2012.
- (12) The volume of groundwater recovered and mass recovered calculations represent the operational period between January 9, 2012 and January 1, 2013.
- (13) The first quarter 2013 totals have been edited from the first quarter report to account for a change in data.
- (14) Starting with the January 2013 site visit the totalized water flow readings are recorded from the SCADA HMI.
- (15) The volume of groundwater recovered and mass recovered calculations represent the operational period between January 1, 2013 and April 1, 2013.
- (16) The volume of groundwater recovered and mass recovered calculations represent the operational period between April 1, 2013 and July 1, 2013.
- (17) The volume of groundwater recovered and mass recovered calculations represent the operational period between January 1, 2013 and July 1, 2013.
- (18) "Total" refers to the amounts removed by the Operable Unit 3 Groundwater Interim Remedial Measure.

Acronyms Key:

IRM	Interim Remedial Measure.
gal	Gallons.
lbs	Pounds.
lbs/day	Pounds per day.
NA	Not applicable.
TVOC	Total volatile organic compounds.

Table 8. Summary of Air Emissions Model Output, Groundwater Interim Remedial Measure, Operable Unit 3
(Former Grumman Settling Ponds), Bethpage, New York.

Notes:

- (1) Only VOCs that were detected in the effluent vapor sample (VSP-5) over the past year of system operation are included in this table.
- (2) AGC refers to the compound-specific annual guideline concentration per the NYSDEC DAR-1 AGC/SGC tables, revised October 18, 2010. NYSDEC DAR-1 AGCs were scaled using the results of a site-specific annual USEPA SCREEN 3 model to calculate the annual MASC per monitoring event.
- (3) Percent of AGC (or Percent MASC) was calculated by dividing the actual effluent concentration by the site-specific annual MASC. Detailed calculations are included in Appendix D.
- (4) Percent AGC is the twelve month average at the end of the reporting period. The Percent AGC was calculated by time-weighting the "Percent MASCs" for the individual sampling events over the past year. MASCs are typically calculated once per quarter, thus the MASCs for each month within a quarter are assumed to be equal.
- (5) During the fourth quarter 2012 reporting period, additional vapor sampling was performed in December 2012 to monitor VPGAC and PPZ treatment efficiencies. For calculation purposes, each of the 4Q2012 sampling events were assumed to be representative for half the quarter (i.e. 1.5 months).

Acronyms Key:

AGC	Annual Guideline Concentration.
DAR-1	Division of Air Resources-1.
MASC	Maximum allowable stack concentration.
NYSDEC	New York State Department of Environmental Conservation.
SGC	Short-term Guideline Concentration.
USEPA	United States Environmental Protection Agency.
VOCs	Volatile Organic Compounds.
$\mu\text{g}/\text{m}^3$	Micrograms per cubic meter.
VPGAC	Vapor Phase Granular Activated Carbon
PPZ	Potassium Permanganate Zeolite

Table 9. Concentrations of Volatile Organic Compounds in Groundwater Samples Collected from Remedial Wells, Groundwater Interim Remedial Measure, Operable Unit 3 (Former Grumman Settling Ponds), Bethpage, New York.⁽¹⁾

Notes:

- (1) Water samples collected by ARCADIS on the dates shown and submitted to Columbia Analytical Services, Inc. for VOC analysis using NYSDEC ASP 2000 Method OLM4.3. Results validated following protocols specified in Sampling and Analysis Plan in the December 2009 DRAFT OM&M Manual (ARCADIS 2009).
- (2) "Total VOCs" represents the sum of individual concentrations of the VOCs detected.
- (3) "Project VOCs" represents the sum of individual compound concentrations of 1,1,1-Trichloroethane; 1,1-Dichloroethane; 1,2-Dichloroethane; 1,1-Dichloroethene; Tetrachloroethene; Trichloroethene; Vinyl Chloride; cis-1,2-Dichloroethene; trans-1,2-Dichloroethene; Benzene; Toluene; and Xylenes-o,m, and p.

Acronyms\Key:

	Indicates an exceedance of an SCG.
700	Bold data indicates that the analyte was detected at or above its reporting limit.
ASP	Analytical services protocol.
B	Compound detected in associated blank sample.
D	Constituent identified from secondary dilution.
J	Value is estimated.
NE	Not established.
NYSDEC	New York State Department of Environmental Conservation.
R	Concentration for the constituent was rejected.
SCGs	Standards, criteria, and guidance values.
VOC	Volatile organic compound.
ug/L	Micrograms per liter.
UB	Compound considered non-detect due to associated blank contamination.
< 5; <5 U	Compound not detected above its laboratory quantification limit.
--	Not analyzed.

Notes:

- (1) Water samples collected by ARCADIS on the dates shown and submitted to Columbia Analytical Services, Inc. for metals analysis using USEPA Method 6010 and for mercury analyses using USEPA Method 7470.. Results validated following protocols specified in Sampling and Analysis Plan in the December 2009 DRAFT OM&M Manual (ARCADIS 2009).
- (2) Beginning January 2012 metals analyses for recovery wells RW-1 and RW-4 are included with annual recovery well sampling performed in October of each year.
- (3) Elevated RW-2 iron concentrations are believed attributed to multiple system shutdowns and re-starts due to a fouled pressure switch on March 2 and March 3, 2013. Turbulence dislodged accumulated iron deposits at the remedial well piping.

Acronyms/Key:

	Indicates an exceedance of an SCG.
700	Bold data indicates that the analyte was detected at or above its reporting limit.
NYSDEC	New York State Department of Environmental Conservation
ASP	Analytical services protocol.
SCGs	Standards, criteria, and guidance values.
ug/L	Micrograms per liter.
--	Not analyzed.
< 5	Compound not detected above its laboratory quantification limit

Notes:

1. Positive groundwater hydraulic gradient indicates a vertically upward gradient and a negative groundwater hydraulic gradient indicates vertically downward gradient.

Table 13. Concentrations of Volatile Organic Compounds in Groundwater Samples Collected from Monitoring Wells, Groundwater Interim Remedial Measure, Operable Unit 3 (Former Grumman Settling Ponds), Bethpage, New York. ^(1,2,3)

Notes:

- (1) Results validated following protocols specified in Sampling and Analysis Plan in the December 2009 DRAFT OM&M Manual (ARCADIS 2009).
(2) Samples analyzed for the TCL VOCs using NYSDEC ASP 2000 Method OLM4.2.
(3) Sampling method changed from 3 well volume purge to HydraSleeve™ no purge method, see Section 6 of this report.
(4) "Total VOCs" represents the sum of individual concentrations of the VOCs detected.
(5) "Project VOCs" represents the sum of individual compound concentrations of 1,1,1-Trichloroethane; 1,1-Dichloroethane; 1,2-Dichloroethane; 1,1-Dichloroethene; Tetrachloroethene; Trichloroethene; Vinyl Chloride; cis-1,2-Dichloroethene; trans-1,2-Dichloroethene; Benzene; Toluene; and Xylenes-o,m, and p.

Acronyms\Key:

	Indicates an exceedance of an SCG.
Bold value indicates a detection.	
Concentration values are rounded to two significant figures.	
Italicized samples collected with HydraSleeve™ no purge method.	
RI/FS	Remedial Investigation/Feasibility Study.
NYSDEC	New York State Department of Environmental Conservation.
TCL	Target compound list.
VOC	Volatile Organic Compound.
ASP	Analytical services protocol.
SCGs	Standards, criteria, and guidance values.
ug/L	Micrograms per liter.
NE	Not established.
E	Concentration for the constituent exceeded the calibration range.
J	Value is estimated.
D	Constituent identified from secondary dilution.
R	Concentration for the constituent was rejected.
B	Compound detected in associated blank sample.
< 5	Compound not detected above its laboratory quantification limit.

GROUNDWATER TREATMENT SYSTEM PROCESS SCHEMATIC, PROCESS FLOW DIAGRAM, AND MONITORING LOCATIONS

**Notes:**

VOC = Volatile organic compound.

lbs = Pounds.

Total VOCs = Sum of VOCs detected.

Project VOCs = Sum of 1,1,1-Trichloroethane; 1,1-Dichloroethane; 1,2-Dichloroethane; 1,1-Dichloroethene; Tetrachloroethene; Trichloroethene; Vinyl Chloride; cis-1,2-Dichloroethene; trans-1,2-Dichloroethene; Benzene; Toluene; and Total Xylenes.

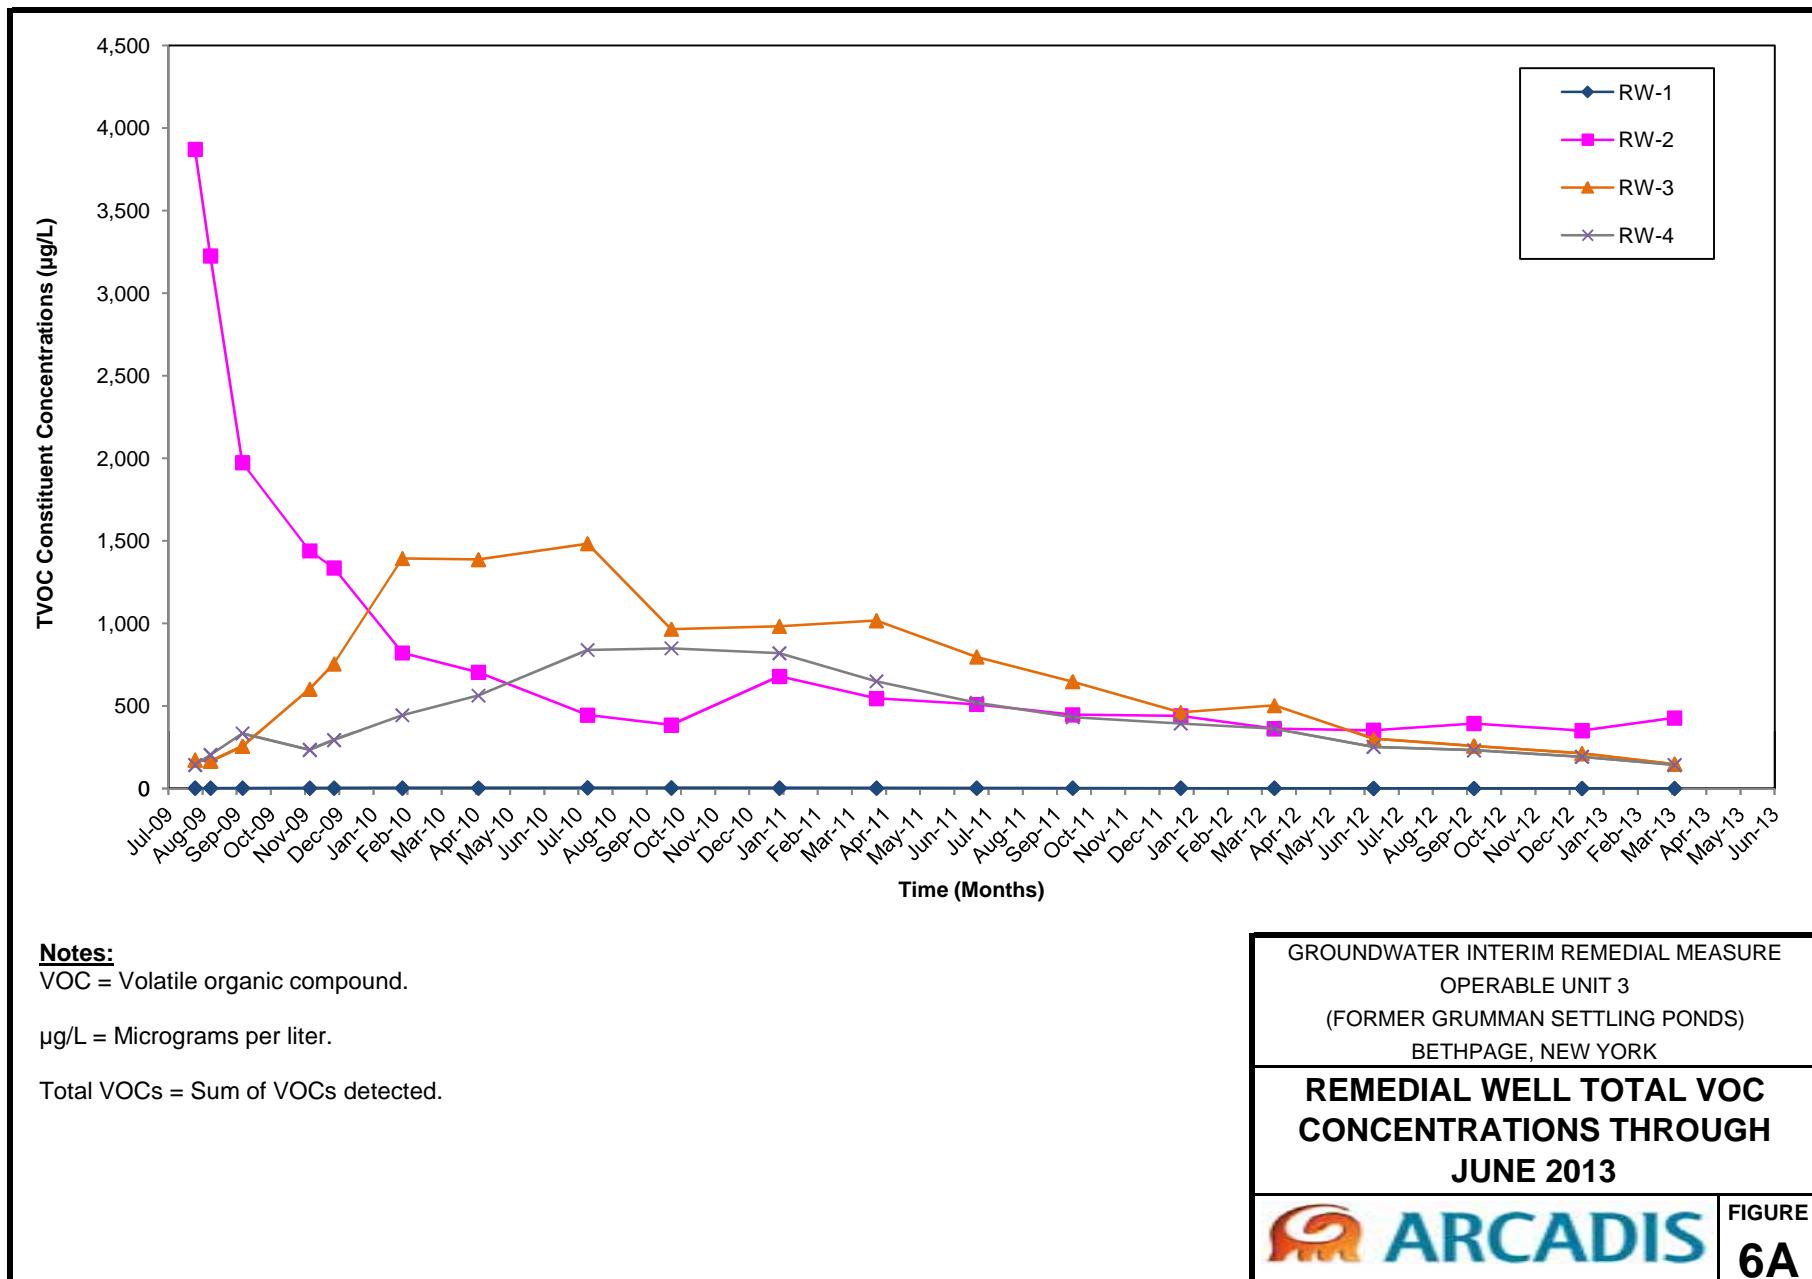

Non-Project VOCs = Sum of Total VOCs that are not Project VOCs.

Notes:

- (1) Water samples will be collected and analyzed in accordance with the method and procedures described in the Sampling and Analysis Plan (SAP).
- (2) Approximate locations of the wells and piezometers in the OU-3 Groundwater Interim Remedial Measure Monitoring Program are shown in Figure 1.
- (3) Water levels will be measured in all wells/piezometers during the baseline monitoring event. Water levels will be measured in accordance with the procedures presented in the SAP.
- (4) VOC: VOCs, per Table D-3 in the Quality Assurance Project Plan (QAPP), using NYSDEC ASP 2000 Method OLM 4.3.
- Cd/Cr: Cadmium and Chromium using USEPA Method 6010.
- Fe/Mn: Iron and Manganese using USEPA Method 6010, both total and dissolved.
- (5) Semiannual wells will be monitored annually after Year 1.
- (6) Some of the analyses listed here are also covered in the Remedial System Sampling Program (Table B-1) and some of the analyses and/or frequencies may be modified based on review of short-term and/or long-term testing results. (e.g. the Cd/Cr sampling frequency was changed from quarterly to annually in 2011).

Acronyms\Key:

Sch. 80 PVC	Schedule 80 polyvinyl chloride.
Sch. 40 PVC	schedule 40 polyvinyl chloride.
SS	Stainless steel.
Steel	Low carbon steel.
ft	Feet.
ft ms	Feet relative to mean sea level.
ft bls	Feet below land surface.
--	Not applicable.
VOC	Volatile organic compound.

Table B-1. Compliance and Performance Program Elements, Groundwater Interim Remedial Measure, Operable Unit 3 (Former Grumman Settling Ponds), Northrop Grumman Systems Corporation, Bethpage, New York.

Notes:

- (1) Refer to Figure 3 of this Operation, Maintenance, & Monitoring (OM&M) Report and Appendix E of the Groundwater IRM OM&M Manual (OM&M Manual (ARCADIS 2009)) for a diagram showing referenced sample locations and measurement points.
- (2) Parameters/methods may be modified based on review of short-term and/or long-term testing results. Parameters shown in **Bold** indicate parameters that require NYSDEC notification/approval prior to change in monitoring schedule.
- (3) Short-term schedule is tentative. Modification may be required/recommended based on the results of start-up and performance testing.
- (4) Long-term schedule is tentative. Modification may be required/recommended based on the results of short-term testing or water quality trends.
- (5) Water samples will be collected in accordance with the methods described in the Sampling and Analysis Plan, which is included as Appendix A of the OM&M Manual (ARCADIS 2009). Samples will be analyzed in accordance with the methods and procedures described in the Sampling and Analysis Plan.
- (6) Per NYSDEC request, a 1-hr pilot test was performed during system shake-down. The 1-hr pilot test samples were also analyzed for Mercury (Hg).
- (7) Per the interim treated effluent (water) discharge criteria provided in the NYSDEC letter dated March 19, 2009, select samples were analyzed for Mercury (Hg).
- (8) As authorized by the NYSDEC, the pH monitoring frequency was reduced from weekly to monthly beginning on February 8, 2010.
- (9) Air samples collected and analyzed in accordance with methods described in the Sampling and Analysis Plan, which is included as Appendix A of the OM&M Manual (ARCADIS 2009).
- (10) Additional air samples will be collected to help calculate media usage rates and to help determine media changeout frequencies.
- (11) Cadmium and Chromium analyses are part of the Environmental Effectiveness Monitoring Program (Table A-1) and the original discharge permit application. They are included here for consistency.

Acronyms\Key:

NA	Not Applicable.
---	Not Required
ECU	Emissions control unit.
VOCs	Volatile organic compounds (refer Tables D-3 and D-5 in the Quality Assurance Project Plan (QAPP) (Appendix D of the OM&M Manual (ARCADIS 2009)) for the analyte lists for aqueous and air samples, respectively).
gal.	Gallons.
gpm	Gallons per minute.
i.w.g.	Inches water gauge.
NYSDEC	New York State Department of Environmental Conservation.
EPA	U.S. Environmental Protection Agency.
SCADA	Supervisory Control And Data Acquisition.
OM&M	Operation, maintenance and monitoring.

Notes:

(1)

Samples collected by ARCADIS on the dates shown and submitted to Columbia Analytical Services, Inc. for VOC analyses using New York State Department of Environmental Conservation ASP 2000 Method OLM 4.3 and metals using USEPA Method 6010, except for mercury, which was analyzed using USEPA Method 7470.

(2) Refer to Figure 3 of this OM&M Report for schematic sample locations.

(3) Results validated following protocols specified in the Sampling and Analysis Plan (Appendix A) of the Groundwater OM&M Manual (ARCADIS 2009).

(4) "Subtotal VOCs" represents the sum of individual concentrations of VOCs detected. Values shown have been rounded to the nearest whole number.

(5) "Subtotal TICs" represents the sum of individual TICs detected. Values shown have been rounded to the nearest whole number.

(6) "Total VOCs" represent the sum of VOCs and TICs detected. Values shown have been rounded to the nearest whole number.

Table C-1. Vapor Sample Analytical Results - April 1, 2013, Groundwater Interim Remedial Measure, Operable Unit 3
(Former Grumman Settling Ponds), Bethpage, New York. ^(1,2,3)

Notes:

- (1) Samples collected by ARCADIS on the dates shown and submitted to Columbia Analytical Services, Inc. for VOC analyses per Modified USEPA Method TO-17A.
- (2) Refer to Figure 3 of this OM&M Report for schematic sample locations.
- (3) Results validated following protocols specified in the Sampling and Analysis Plan (Appendix A) of the Groundwater OM&M (ARCADIS 2009).
- (4) "Subtotal VOCs" represents the sum of individual concentrations of VOCs detected. Values shown have been rounded to the nearest whole number.
- (5) "Subtotal TICs" represents the sum of individual top 20 TICs detected. Values shown have been rounded to the nearest whole number.
- (6) "Total VOCs" represent the sum of VOCs and TICs detected. Values shown have been rounded to the nearest whole number.

Acronyms\Key:

Bold value indicates a detection.

D	Concentration is based on a diluted sample analysis.
DJ	Estimated value of a diluted sample analysis.
dup	Duplicate sample.
IRM	Interim Remedial Measure.
J	Estimated value.
JN	Compound tentatively identified, concentration is estimated.
OM&M	Operation, maintenance and monitoring.
NYSDEC	New York State Department of Environmental Conservation.
R	The sample results are rejected.
TIC	Tentatively identified compound.
USEPA	United States Environmental Protection Agency.
VOC	Volatile organic compound.
ug/m ³	Micrograms per cubic meter.
< 9.2 U	Compound not detected above its laboratory quantification limit.
--	TIC not detected.

Appendix D

Air Discharge Quality Evaluation

Table D-1. Annual Summary of SCREEN3 Model Input and Outputs, Groundwater Interim Remedial Measure, Operable Unit 3
 (Former Grumman Settling Ponds), Bethpage, New York.

Parameters	Date Sampled:	07/05/12	10/03/12	12/03/12	02/04/13	04/01/13
SCREEN3 Model Input						
Source Type		Point	Point	Point	Point	Point
Emission Rate (g/s)		1	1	1	1	1
Stack Height (ft)		13.5	13.5	13.5	13.5	13.5
Stack Height (m)		4.1	4.1	4.1	4.1	4.1
Stack Inside Diameter (m)		0.36	0.36	0.36	0.36	0.36
Air Flow Rate (scfm) ^{(1),(9),(11)}		2,020	1,813	1,962	1,885	1,899
Air Flow Rate (acf m @ stack temp) ⁽²⁾		2,053	1,839	1,974	1,866	1,891
Stack Gas Exit Temperature (K) ^{(1),(9),(10)}		299	299	296	291	293
Ambient Air Temperature (K) ⁽³⁾		302	294	284	271	281
Receptor Height (m) ⁽⁴⁾		1.5	1.5	1.5	1.5	1.5
Urban/Rural		Urban	Urban	Urban	Urban	Urban
Building Height (m)		2.6	2.6	2.6	2.6	2.6
Min Horizontal Bldg Dim (m)		7.9	7.9	7.9	7.9	7.9
Max Horizontal Bldg Dim (m)		9.8	9.8	9.8	9.8	9.8
Consider Bldg Downwash?		Yes	Yes	Yes	Yes	Yes
Simple/Complex Terrain Above Stack		Simple	Simple	Simple	Simple	Simple
Simple/Complex Terrain Above Stack Base		Simple	Simple	Simple	Simple	Simple
Meteorology		Full	Full	Full	Full	Full
Automated Distances Array		Yes	Yes	Yes	Yes	Yes
Terrain Height Above Stack Base		0	0	0	0	0
SCREEN3 Model Output						
1-HR Max Concentration at Receptor Height ($\mu\text{g}/\text{m}^3$) ⁽⁵⁾		1,950	2,229	2,059	2,215	2,169
Annualization Factor ⁽⁶⁾		0.08	0.08	0.08	0.08	0.08
Average Annual Concentration at Receptor Height ($\mu\text{g}/\text{m}^3$) ⁽⁷⁾		156	178.3	164.7	177.2	173.5
Distance To Max Concentration (m) ⁽⁸⁾		8	8	8	8	8

See notes on last page.

Table D-1. Annual Summary of SCREEN3 Model Input and Outputs, Groundwater Interim Remedial Measure, Operable Unit 3
(Former Grumman Settling Ponds), Bethpage, New York.

Notes:

- (1) The stack air flow rate (in scfm) and temperature were measured using inline instrumentation. Values were measured at the blower effluent location.
- (2) The stack air flow rate at the stack temperature (in acfm) was calculated by dividing the stack air flow rate in scfm by the ratio of the standard temperature to the actual stack gas exit temperature in degrees Rankine.
- (3) The ambient temperature was recorded from the weather.newsday.com and/or weather underground (www.wunderground.com) websites for Islip, New York. The mean actual temperature from the website(s) was used in model calculation.
- (4) The receptor height corresponds to the average inhalation level.
- (5) SCREEN3 calculated constituent concentration at listed conditions at the specified inhalation level.
- (6) A USEPA time averaging conversion factor of 1/0.08 was used to convert the 1-hour maximum concentration output to an annual average.
- (7) Average annual constituent concentration at the receptor height was calculated by multiplying the one hour maximum concentration by the annualization factor.
- (8) SCREEN3 calculated distance to the 1-hour maximum concentration.
- (9) Stack Air Flow Rate and Exit Temperature parameter readings were recorded on October 3, 2012 at the time of October 3, 2012 air sample collection.
- (10) Mid-Train temperature was used for stack exit temperature as stack exit temperature was not recorded at the time of October 3, 2012 air sample collection.
- (11) Beginning with the January 2013 site visit the air flow rate in scfm is obtained from SCADA HMI.

Acronyms\Key:

µg/m ³	Micrograms per cubic meter.
acfm	Actual cubic feet per minute.
ft	Feet.
g/s	Grams per second.
K	Kelvin.
m	Meters.
scfm	Standard cubic feet per minute.
USEPA	United States Environmental Protection Agency.

Table D-2. Annual Summary of Maximum Allowable Stack Concentration Calculations, Groundwater Interim Remedial Measure, Operable Unit 3
 (Former Grumman Settling Ponds), Bethpage, New York.

Compound	Actual Effluent Concentrations ⁽¹⁾ ($\mu\text{g}/\text{m}^3$)				
	07/05/12	10/03/12	12/03/12	02/04/13	04/01/13

Notes:

- (1) Actual effluent concentrations are analytical results from air samples collected on the dates shown. Data in this table corresponds to approximately the past year of system operation.
- (2) AGC refers to the compound-specific annual guideline concentration per the NYSDEC DAR-1 AGC/SGC tables, revised October 18, 2010.
- (3) Maximum allowable stack concentrations were calculated by dividing the product of the annual guideline concentration of a compound and the ratio of the SCREEN3 gas emission rate and the SCREEN3 average concentration at receptor height by the air flow rate at the stack temperature and multiplying by the appropriate conversion factors.
- (4) Percent of MASC was calculated by dividing the actual effluent concentration by the MASC for a given monitoring event.

Acronyms\Key:

µg/m ³	Micrograms per cubic meter.
AGC	Annual guideline concentration.
MASC	Maximum allowable stack concentration.
